In our recent research, LiF-MO (M = Mn, Fe, Co, Ni) composites synthesized by the mechanical milling worked as the cathode material of lithium-ion batteries. The LiF-NiO and LiF-MnO composites showed the highest discharge voltage and capacity, respectively[1]. The discharge capacity of LiF-MnO composite was highest and the discharge voltage was lower than LiF-NiO. Therefore, it is predicted that discharge voltage can be improved by adding NiO to MnO while maintaining high discharge capacity of LiF-MnO composite. In this study, we synthesized LiF-NiₓMn₁₋ₓO composites from LiF and the solid solution of NiO and MnO, to obtain high energy density and characterized the composites.

Experimental
NiₓMn₁₋ₓO were synthesised by the mechanical milling for 6 h and calcine in vacuum for 6 h. LiF-NiₓMn₁₋ₓO composites in a molar ratio of 1:1 were synthesized by the mechanical milling of LiF and NiₓMn₁₋ₓO for 72 h. The synthesized composites were investigated by XRD, charge-discharge measurements, and XPS. The cathode sheets were fabricated using the synthesized composite sample (70 wt%), KETJENBLACK (20 wt%), and polyvinylidene fluoride (10 wt%). The charge-discharge measurements were performed using a stainless steel cell for voltages of 2.0-4.8 V (versus Li/Li⁺). The test cell was composed of a sheet of the synthesized composite as the cathode, a piece of lithium foil as the anode, and 1 M LiPF₆-EC/EMC (1:1 by volume) as the electrolyte.

Results & Conclusions
We confirmed NiₓMn₁₋ₓO and LiF-NiₓMn₁₋ₓO composites were synthesized from XRD measurement. Figure shows the discharge curves of LiF-NiₓMn₁₋ₓO composites. The discharge capacities of samples exceeded 150 mAh⁻¹. The average discharge voltage increased with the amount of Ni. The discharge capacity changed by adding Ni and reached the maximum value at Ni : Mn = 2:8 to be 279 mAh⁻¹. The energy density was also greatest value at Ni : Mn = 2:8, 868 Whkg⁻¹. The energy density of LiF-MnO( Ni : Mn = 0:10 ) composite was 610 Whkg⁻¹. Energy density improved by 42 % compared with LiF-MnO composites. Adding NiO to LiF-MnO composites was effective in improving energy density.
